

AURIX™

AURIX™ AND PRESSURE RELIEF

AURIX WORKS BEST WHEN THERE IS NO PRESSURE ON THE WOUND

Aurix™ helps your wound heal through a biodynamic gel made from your own blood. During your treatment with Aurix you must take more steps to help your wound heal. Pressure relief is especially important for wound healing.

CARING FOR NEWLY FORMING CELLS

Aurix helps jumpstart the healing process, starting with the formation of new cells. These cells are fragile and can be damaged easily. Damage to these cells will stop the healing process. As a result, it's important to protect your wound at all times.

PRESSURE RELIEF

To protect new cells and successfully heal your wound with Aurix therapy, it is very important to keep pressure off your wound. Protecting your wound from pressure is called "pressure relief."

WHY PRESSURE RELIEF IS IMPORTANT

Pressure relief will support Aurix therapy by allowing blood to flow more freely to your wound. Blood flow delivers oxygen and other nutrients to the cells to help them grow and heal. If there is pressure on the wound, it stops the blood flow like turning off a faucet.

PRESSURE RELIEF:

- Protects new cells from damage
- Clears the way for blood, oxygen, and nutrients to get to the wound
